## **Off-Shelf Displays**

Work safely & avoid injuries by following the points below for every task

## **Stacked Product Displays**

- Cases are stacked to add strength and stability to the display. E.g. Interwoven.
- Do not cut cases at the bottom! This weakens the display.
- Cases at the top of the display should only be "cut" to display the product.
- Ensure display is in a suitable position.
   Make sure it doesn't block movement around the store or restrict safe access to fire exits / equipment.
- Ensure the product chosen is suitable. It
  must be safely displayed / stacked
  without any reasonable expectation that
  it will topple, fall or collapse.
- Where suitable ensure plinths are used to provide the display with a strong base off the floor.
- Ensure all off-shelf displays are regularly checked for presentation and safety.

- Colleagues involved in building the display should remain aware of customers and colleagues around them.
- Ensure the height of the display does not encourage / require customers to take products from lower parts of the display. "Safe" maximum heights will vary but general advice is to ensure the top products are at approx. 5ft.
- If "case-cutting" must use a suitable case knife.
